

AI Prototype Challenge:

You are an AI consultant helping a client solve a real business problem using AI. Your goal is to quickly turn an unclear problem into a working solution.

Your Task:

- Build a simple AI prototype that shows how the solution would work
 - Create one slide to explain and pitch your idea
 - Walk through your prototype and explain your decisions in a live interview
-

Manufacturing: Production Issue Resolution Assistant

A manufacturing operations manager oversees several plants or production lines and needs quick insight when something goes wrong — quality issues, throughput drops, supplier delays, equipment downtime, or safety concerns.

The solution accepts:

A short problem statement (e.g., “output dropped on Line B,” “defect spike,” “missed supplier delivery”), plant or line ID, timeframe, and any optional logs or notes.

The solution produces:

- A root-cause hypothesis with confidence levels
 - Actionable recommendations broken into “Stabilize / Investigate / Prevent recurrence”
 - A short explanation referencing process standards, prior incidents, maintenance history, or quality thresholds
 - A next-step package (e.g., draft a shift handoff note, create a maintenance request, outline a corrective action plan, generate questions for suppliers)
-

Financial Services: Client & Risk Insight Brief

A financial advisor, relationship manager, or internal risk team member is preparing for a client conversation or internal review and needs a clear, well-structured snapshot that balances opportunity and risk.

The solution accepts:

A client name, account type, or portfolio identifier, plus the meeting goal (advisory review, risk assessment, onboarding, renewal).

The solution produces:

- A concise client or portfolio overview (key facts + what’s missing)
- Talking points tailored to the meeting objective (performance drivers, changes, concerns)
- A risk and compliance watch-list (exposure shifts, policy constraints, anomalies)

- A list of recommended follow-ups (documents to request, questions to ask, internal checks to run)
 - Optional: a draft follow-up email or meeting summary
-

Healthcare: Emergency Department Triage Support Assistant

An emergency department receives a continuous flow of patients with varying levels of urgency. During peak hours, clinicians must make fast triage decisions with incomplete information while balancing patient safety and limited resources such as beds and staff. As volume increases, it becomes harder to consistently determine who needs immediate attention, who can safely wait, and what actions should happen next.

The hospital wants a lightweight assistant to support triage decisions during high-volume periods, augmenting clinical judgment with structured guidance and context.

The solution accepts:

A set of patient cases, which may include structured data (e.g., vitals, arrival time), free-text notes (e.g., symptoms, nurse observations), historical context, or a combination. Inputs may be incomplete, inconsistent, or change over time as new information becomes available.

The solution produces:

- A triaged assessment of each patient's urgency (who should be seen now, who can wait, and what information is missing)
 - Recommended next actions organized as "Immediate / Monitor / Escalate or Redirect"
 - A brief explanation of why those actions are suggested, referencing relevant clinical signals, triage guidance, prior patterns, or contextual factors
 - A follow-up checklist (e.g., assign a bed, notify a clinician, request additional vitals, flag for reassessment, document handoff notes)
-

Open Choice Create your own AI use case any industry of your choice.

Environment & Data: You have flexibility in how you build your solution. Choose the approach that best demonstrates your capabilities. Data is not provided—you are responsible for sourcing or creating your own.

Deliverables

1. Working Prototype – Demonstrable via live demo; focus on core functionality over polish.
2. One Slide – Single slide to support your pitch to stakeholders.
3. Live Interview – Present your slide, demo your prototype, and answer questions
